Mark

20

- Time allowed is 1½ hours.
- Write down your answer in the space provided underneath the question.
- Numbers within brackets [#] are the marks.
- You may use a programmable calculator and/or the formula sheet.

Z _{0.10}	Z _{0.05}	Z _{0.025}	Z _{0.01}	Z _{0.005}
1.285	1.645	1.96	2.325	2.575

Question 1:

A random sample of size $n=144$ was selected from a population with mean $\mu=20$ and standard deviation $\sigma=9$.

- a. What is the approximated sampling distribution of the sample mean \bar{X} ? [1]
- b. What is the mean of \bar{X} ? [1]
- c. Calculate the standard error of \bar{X} . [1]
- d. Find the probability that the sample mean \bar{X} deviates from the population mean $\mu=20$ by no more than 2. [1]

Question 2:

One of the ways most American relieve stress is to reward themselves with sweets. According to one study, 40% admit to overeating sweet foods when stressed. Suppose that the figure 40% is correct and that a random sample of =500 Americans is selected. Suppose that \hat{p} is the sample proportion.

- a. What is the approximated sampling distribution of \hat{p} ? [1]
- b. What is the mean of \hat{p} ? [1]
- c. Calculate the standard error of \hat{p} ? [1]
- d. Compute the probability that the sample proportion, \hat{p} , exceeds 0.45. [1]

Question 3:

Suppose that we are interested in estimating the population mean (μ) of a quantitative variable. A random sample gives the following results: $n = 49$, $\bar{X} = 14.1$, and $S^2 = 4$.

- a. Find a point estimate for the population mean (μ). [1]
- b. Find a 95% margin of error of estimating μ by $\bar{X} = 14.1$. [1]
- c. Find a 95% confidence interval for the population mean (μ). [2]
- d. Interpret the 95% confidence interval that you have found in part (c). [1]

Question 4:

Suppose that we are interested in estimating a population proportion (or binomial probability, p) of a qualitative variable. A random sample gives the following results: (i) Sample size $n = 50$, (ii) Number of successes $X = 40$.

- a. Find a point estimate for the population proportion (p) and denote it by \hat{p} . [1]
- b. Find a 95% margin of error of estimating p by \hat{p} . [1]
- c. Find a 95% confidence interval for the population proportion (p). [2]
- d. Interpret the 95% confidence interval that you have found in part (c). [1]

Question 5:

Suppose that we are interested in estimating a population proportion (p) by the sample proportion (\hat{p}). Determine the sample size (n) if we wish to be 95% confident that the error of estimation will not exceed 0.06. (i.e., we want \hat{p} to be within 0.06 from the true value of p with probability equal to 0.95. [2]
